

Multi-Regional Inoperability Input-Output Modelling using Disaster-REALM

Krista Danielle Yu
School of Economics
De La Salle University

National IO Models vs. Regional IO Models

- National IO Model: Macro view of the entire economy, showing inter-industry transactions on a national scale
- Regional IO Model:
 - Single Region Model: shows the intra-regional flow of transactions, treats all other regions as part of the rest of the world.
 - Inter Regional Input-Output Model (IRIO): Single Region Model with intra-regional transaction flows; Data gathered through survey
 - Multi Regional Input-Output Model (MRIO): Single Region Model with intra-regional transaction flows; Data gathered through non-survey methods or hybrid methods; an estimation of IRIO.

Why Regionalize?

- Technology of production of each region is specific
 - It may be very close or very different from the national table.
- To account for cross-regional interdependencies.
 - Demand footprint – purchasing goods and services from other regions
 - Supply footprint – supplier of goods and services for other regions
- Policymakers can mitigate risks against:
 - Disaster scenarios that produce supply perturbations in their demand footprint
 - Disaster scenarios that produce demand perturbations in their supply footprint

Single Regional IO Model Schematic

Multiregional IO Schematic

Multi-Regional Inoperability Input-Output Modelling using Disaster-Realm

Examples of MRIOs

■ Global Models

- World Input-Output Database (WIOD) –environment and socio-economic indicators
- Global Trade Analysis Project (GTAP) – focuses on trade
- OECD – focuses on TiVA more specifically on manufacturing sectors
- Asian International IO Table (IDE-JETRO) – concentrates on Asian economies with 70 sectors
- EORA – extensive environmental indicators including 187 countries
- ADB MRIO- includes 45 economies and 35 sector breakdown

■ Country Level

- Japan
- China
- Australia
- US

Constructing the MRIO

From \ To		Luzon			Visayas			Mindanao			Final Demand	Total Output
		AGR	IND	SRV	AGR	IND	SRV	AGR	IND	SRV		
Luzon	S1	Z_{11}			Z_{12}			Z_{13}			f_1	x_1
	S2											
	S3											
Visayas	S1	Z_{21}			Z_{22}			Z_{23}			f_2	x_2
	S2											
	S3											
Mindanao	S1	Z_{31}			Z_{32}			Z_{33}			f_3	x_3
	S2											
	S3											
Value Added		v_1			v_2			v_3				
Total Input		x_1^T			x_2^T			x_3^T				

Taal Eruption

- Started on January 12, 2020
- Several towns on lockdown
 - Households evacuated
 - Workforce inoperability
- Businesses – hotels, restaurants, farms etc..
shutdown due to ashfall and impending explosive eruption
- Schools converted to evacuation centers

Multi-Regional Inoperability Input-Output Modelling using Disaster Realm

Simulation Considerations

- 5-Region MRIO Table
 - NCR
 - Region 4A
 - Rest of Luzon
 - Visayas
 - Mindanao
- 14 Sectors
 - Agriculture, Fishery and Forestry
 - Mining and Quarrying
 - Manufacturing
 - Construction
 - Electricity, Gas and Water
 - Land Transportation
 - Water Transportation
 - Air Transportation
 - Communication
 - Trade
 - Finance
 - Real Estate and Ownership of Dwelling Places
 - Private Services
 - Government Services

Perturbation Estimates

- Based on NDRRMC's situation reports:
 - Damages to Agriculture and Livestock
 - Power Outages
 - Towns affected
- System perturbations introduced
 - Agriculture, Fishery and Forestry – 5%
 - Electricity, Gas and Water – 5%
 - Real Estate and Ownership of Dwelling Places – 1%
 - Private Services – 1%

Inoperability levels

The screenshot displays the MRIIM Tool interface. The background is a dark green sidebar with navigation links: Home, Tools, Data, About us, Contact us, Help, and Language|言語. The main content area is a light gray. A modal dialog box titled "Select Perturbations" is open, showing a search bar with "mindanao" entered. Below the search bar, there are three checkboxes: "Agriculture" (checked), "Industrial" (unchecked), and "Services" (unchecked). A "Done" button is located at the bottom right of the dialog box. The sidebar also features sections for "Select Country" (Philippines), "Select Year & Sector" (2015 Philippines 3 Sec), and "Impacted Region/s" (Luzon, Visayas, Mindanao).

Conclusion and Future Recommendations

- This study has developed 3 tools available through a web-based freeware founded on sound economic models
 - IIM Tool for static analysis
 - DIIM Tool for dynamic analysis
 - MRIIM Tool for multiregional analysis
- This platform uses technology to give information to policy makers backed with science-based estimates.
- This study is able to show that while national level input-output analysis can provide good estimates, it is better to have regional level tables in order to see the interactions between sectors within regions and across regions.
- The Taal Volcano Eruption's economic impact is not limited to its nearby regions, but extends to the rest of the country.
- There is a need to develop MRIIM models with higher resolution in order to derive more region-specific results.
